

University of Pennsylvania
The Wharton School
MGMT 970
Applied Research Methods for Management
Fall 2011
Wednesday 1:30-4:30pm, Bowman Room

Course Description:

Students taking the course will be introduced to the seminal readings on a given method, have a hands-on discussion regarding their application often using a paper and dataset of the faculty member leading the discussion. The goal of the course is to make participants more informed users and reviewers of a wide variety of methodological approaches to Management research.

Course Requirements

The course grade will be based on class participation (33%) and the submission of an empirical paper or draft that uses a method covered in class for “review” by the faculty member teaching that method (67%). The paper need not be written for this class and should ideally be a paper that you are working on for your second year paper requirement, dissertation proposal or another external research project.

Participation

Regular attendance and participation are critical to your successful completion of this course. You should complete the assigned readings and assignments prior to each class. You are encouraged to prepare for class with your colleagues; however, each member of the class should be fully conversant in the material—expect to participate in every class.

Policy on Auditors

Advanced students who do not wish to enrol as full participants are welcome to audit the course, under the following conditions: (1) you commit to attend at least 75% of the class sessions, and inform me in advance which sessions you will attend; (2) you complete the assigned readings and assignments for the classes that you attend; and (3) you participate fully in the sessions that you attend, including doing a “fair share” of class discussion. Auditing students are excused from submitting a class paper and should not expect a “review” from the instructors of the class.

Reading Materials:

There is no bulkpack for this class. PDF versions of the readings will be put on webCafé or distributed in hard copy in the week prior to class. Data for assignments will also be distributed via WebCafe.

Prerequisites:

MGMT 953, Research Methods or a similar course covering the Philosophy and Design of Social Science Research.

Oxley, J., J. Rivkin, M. Ryall and the Strategy Research Initiative, (2010) “Recognizing and Encouraging High Quality Research in Strategy” pp. 10-14

Students unfamiliar with STATA should review the materials in

https://faculty-cafe.wharton.upenn.edu/eRoom/depts/DoctoralMaterials/0_980da

9/7: Introduction and a Refresher on OLS Regressions (Iwan Barankay)

Readings

TBD

Assignment

TBD

9/14: Discrete Choice (Matthew Bidwell)

Readings

- 1) Pampel, Fred C. 2000. "Logistic Regression – A Primer". Sage: Quantitative Applications in the Social Sciences 07-132. Pages 1-54 [TO BE DISTRIBUTED IN HARD COPY IN CLASS on 9/8]
- 2) Hoetker, G. 2007. The use of logit and probit models in strategic management research: critical issues. *Strategic Management Journal* **28** 331-343.
- 3) Bidwell, M. 2010. Why Has Job Mobility Increased? Unions, Organizational Size and the Growth of External Hiring

Assignment

- 1) Replicate Tables 2 and 3 (don't worry if you can't get them exactly)
- 2) Provide three different ways to evaluate the magnitude of important effects from Table 2. What are the strengths and weaknesses of the different approaches?
- 3) We will discuss in detail some of the decisions that I made in setting up the analyses. What do you think about the specific approach I have taken to addressing the issues I am interested in? What other approaches to analyzing the data might I have taken, given the constraints of the data available to me?

9/21 Count (David Hsu)

Reading (Focal)

- 1) F. Murray and S. Stern. 2007. "Do formal intellectual property rights hinder the free flow of scientific knowledge? An empirical test of the anti-commons hypothesis," *Journal of Economic Behavior and Organization*, 63: 648-687.

Readings (Additional for those without a strong background in count models)

- 2) Cameron, A. Colin & Pravin Trivedi. 1986. Econometric Models Based on Count Data: Comparisons and Applications of Some Estimators and Tests. *Journal of Applied Econometrics*, 1: 29-53.
- 3) Woolridge, Jeffrey M., 2002. *Econometric Analysis of Cross Section and Panel Data*. MIT Press, pp. 645-683.

Readings (Supplementary)

- 4) Hausman, Jerry, Bronwyn Hall, & Zvi Griliches. 1984. Econometric Models for Count Data with an Application to Patents-R&D Relationship. *Econometrica*, 52(909-938).
- 5) Cameron, A. Colin & Pravin Trivedi. 1998. *Regression Analysis of Count Data*. New York, NY: Cambridge University Press.

Assignment

To prepare for our session, I would like you to read the Murray and Stern (JEBO, 2007) paper. It is oriented toward science policy, but gives a nice illustration of applied count data analysis. Also, if you do not have prior exposure to econometric count data models, please read the Woolridge (2002) chapter and/or the Cameron and Trivedi (1986) article (both are available in electronic form in the class webcafe). For further background, I have also uploaded the Hausman, Hall &

Griliches (1984) paper, which derives panel data estimators for count data models. The Cameron and Trivedi (1998) book is a standard reference in this domain (consult the library or buy the book if you are interested). Finally, the reference to Stata code implements robust standard errors for fixed effects Poisson models, a feature which does not come standard in Stata (Stata has standard commands for fixed and random effects Negative Binomial panel models).

My plan for the session is to mainly cover the *application* of count data models within the context of research study design. To that end, we will discuss and debate the Murray and Stern paper from the standpoint of choices they made in their study design. In the second part of class, I will motivate a separate research question that is centered more on business policy. We will then form several teams and work in parallel in brainstorming research study designs. We will then reconvene and discuss and debate the merits of each of the study designs. Please come prepared to actively participate.

9/28 Panel data (in linear, discrete choice or count, fixed vs. random effects, clustering, autocorrelation including spatial, pcse, GMM, ...) (Iwan Barankay)

Readings

- 1) Chapter 5 from Angrist and Pischke “Mostly Harmless Econometrics”

Assignment

?

10/5 Dealing w/ endogeneity: Selection, instruments, propensity score matching (Evan Rawley)

Readings

1. Chapter 4 of “Mostly Harmless Econometrics” [Distributed in Hard Copy]
2. Campa, Jose Manuel and Simi Kedia (2002) ‘Explaining the Diversification Discount’ *Journal of Finance* 57(4):1731-62.
3. David, Guy, Dan Polsky and Evan Rawley (2010) ‘Asset Ownership, Task Alignment and the Theory of the Firm: Evidence from Patient Care’ *Working Paper*

Assignment

This class will focus on two methods commonly used to “deal with endogeneity”: matching on observables and instrumental variables.

The chapter from Mostly Harmless will be distributed in hard copy. It discusses the econometric theory behind instrumental variables.

The papers are attached in webCafé. Campa and Kedia is an excellent example of the power of propensity score matching—it attacks a classic result in the diversification literature that did not “deal with endogeneity” very well. We will use this paper to discuss the strengths and weaknesses of propensity score matching. Also, we will set up STATA code for performing propensity score matching and discuss statistical techniques for evaluating whether the results of matching are “good.”

My paper with Guy David and Dan Polsky uses a new matching technique, called Coarsened Exact Matching (CEM), that is superior to propensity score matching in some ways and is easy to apply. Besides discussing CEM we will also use the paper to discuss the implementation of a two-stage instrumental variables approach, and how to evaluate whether an IV is “good.”

I’ve listed some optional readings below for students who are interested in more background material on dealing with endogeneity.

Matching

Levine, David I., and Michael W. Toffel. "Quality Management and Job Quality: How the ISO 9001 Standard for Quality Management Systems Affects Employees and Employers." *Management Science* 56, no. 6 (June 2010): 978-996.

Stefano M. Iacus, Gary King, Giuseppe Porro. Causal Inference Without Balance Checking: Coarsened Exact Matching. October 12, 2009. Mimeo.

Heckman correction

J. Myles Shaver. 1998. Accounting for Endogeneity When Assessing Strategy Performance: Does Entry Mode Choice Affect FDI Survival? *Management Science*, Vol. 44, No. 4., pp. 571-585.

Villalonga, Belen. Does Diversification Cause the "Diversification Discount"? *Financial Management*, Vol. 33, No. 2. (Summer, 2004), pp. 5-27.

Instrumental variables

Nevo, Aviv. 2000. “Mergers with Differentiated Products: The Case of the Ready-to-Eat Cereal Industry,” *The RAND Journal of Economics*, 31(3), 395-421, 2000. Reprinted in P. Joskow and M. Waterson ed., *Empirical Industrial Organization*, Edward Elgar, 2004.

Novak, Sharon and Scott Stern. 2008. How Does Outsourcing Affect Performance Dynamics? Evidence from the Automobile Industry. *Management Science* Vol. 54, No. 12, December 2008, pp. 1963-1979

10/12 Survival/Failure/Event History & event studies (Witold Henisz)

Readings

- 1) Kiefer, Nicholas M. (1988) “Duration Data and Hazard Functions” *Journal of Economic Literature* 26(2): 646-679.
- 2) Box-Steffensmeier, Janet M. (1997) “Event History Models in Political Science” *American Journal of Political Science* 41(4): 1414-1461

- 3) Allison, Paul D. (2010) "Survival Analysis" Pp. 413-425 in *The Reviewer's Guide to Quantitative Methods in the Social Sciences*, edited by Gregory R. Hancock and Ralph O. Mueller. New York: Routledge.
- 4) Henisz, W. J. & Delios, A. (2001). "Uncertainty, Imitation, and Plant Location: Japanese Multinational Corporations, 1990-1996." *Administrative Science Quarterly*, 46(3): 443-75.
- 5) Jensen, M. (2006) "Should We Stay or Should We Go? Accountability, Status Anxiety, and Client Defections." *Administrative Science Quarterly*, 51(1):97-128.

Data Assignment

Using the dataset examining leadership mortality (of a sample of national political leaders) available in the eRoom answer the following questions. Use STATA help and manuals to help you as needed.

- 1) What is the origin time for each leader (i.e., the time at which a leader begins to be at risk for being deposed)? Explain.
- 2) How many leaders
 - a. survived one year?
 - b. are right censored?
- 3) Construct a life table for the data.
- 4) Plot the survivor function assuming a Weibull and exponential distribution.
- 5) Plot a hazard function
- 6) Do your plots lead you to favor a parametric or partial likelihood approach to modeling this data? Why?
- 7) What do you think the appropriate functional form to measure the likelihood of losing power over time is? Explain.
- 8) What determines the likelihood of losing power? Does it depend on the type of loss (i.e., natural death, constitutional or non-constitutional transfer)?

Discussion Questions

- 1) Conceptually discuss the variables that the authors used to stset the data in the Henisz & Delios and Jensen papers. To answer this questions you need to have a clear sense of the data structure and the types of data needed to determine the origin, length and termination of a spell for data with time varying independent variables.
- 2) Conceptually discuss the variables that you would use to stset the data in a paper of interest to you that is amenable to event history/survival analysis.
- 3) What functional form and other modeling choices would you make for this dataset? Why?

10/19 Experiments (Lab & Field) (Adam Grant)

Readings

- 1) Aronson, E., Wilson, T. D., & Brewer, M. (1998). Experimentation in social psychology. In D. T. Gilbert, S. T. Fiske, & G. Lindzey (Eds.), *The handbook of social psychology*, Volume 2 (4th Ed.) (pp. 99-142). New York: McGraw-Hill.
- 2) Cooper, W. H., & Richardson, A. J. 1986. Unfair comparisons. *Journal of Applied Psychology*, 71: 179-184.
- 3) Latham, G. P., Erez, M., & Locke, E. A. 1988. Resolving scientific disputes by the joint design of crucial experiments by the antagonists: Application to the Erez-Latham dispute regarding participation in goal setting. *Journal of Applied Psychology*, 73: 753-772.
- 4) Prentice, D. A., & Miller, D. T. (1992). When small effects are impressive. *Psychological Bulletin*, 112, 160-164.

Assignment

- 1) List at least two causal hypotheses that you are interested in testing your own research.
- 2) For one hypothesis, write out the design of a laboratory experiment to test it, including the task, how you would manipulate the independent variable, and how you would measure the dependent variables.
- 3) For the other hypothesis, write out the design of a field experiment or quasi-experiment to test it, including the organizational setting, how you would create or track changes in the independent variables, and how you would measure the dependent variables.

10/26 Factor Analysis & Structural Equation Modeling (Nancy Rothbard)

Readings

- 1) Edwards, J. R. & Bagozzi, R. P. 2000. On the Nature and Direction of Relationships Between Constructs and Measures. *Psychological Methods*, 5(2): 155-174.
 - o The Edwards and Bagozzi (2000) article addresses underlying factor analysis issues from a theoretical perspective.
 - o As you read it, think about your own data sets and whether you have reflective or formative indicators of a latent construct and what the theoretical and methodological implications of that are.
- 2) Chapter 8 "Hypothesis Testing" in Kline, R. (2010). *Principles and Practice of Structural Equation Modeling*, Third Edition.
 - o Read this chapter to become familiar with the various model statistics used to interpret structural equation models. We will go over these in the session and talk about questions you might have. And what caveats there might be to the advice he gives regarding model evaluation.
- 3) Rothbard, N. (2001). Enriching or Depleting? The dynamics of engaging in work and family roles. *Administrative Science Quarterly*, 46: 655-684.
 - o This is one of my empirical papers that uses structural equation modeling. Take a look at the front end to see what the hypotheses are, but you only need to carefully read the methods and results sections.
 - o Look at the model statistics that are reported.
 - o Look at Table 2 which gives you the information you would need to reconstruct the confirmatory factor model.

- o The methods and results section talk about using instrumental variables to identify a non-recursive (i.e. reciprocal) model. Bring questions you have about model identification.

Assignment

As you prepare for the session, if you have a data set that you are working on, please bring some data for us to work with (have it in electronic form so we can cut and paste it into some Lisrel syntax during the session. Please limit the number of constructs to 5 and bring a correlation matrix at the item level and means and standard deviations of each item.

- For example, if you have a 3 item scale of job satisfaction, a 3 item scale of organizational commitment, a 4 item scale of intrinsic motivation, and a single item measure of performance, you would need a correlation matrix of the 11 items that represent these 4 constructs.
- If you have a 3 item job satisfaction scale a 3 item organizational commitment scale, a single item performance evaluation measure, a single item indicator of gender and a single item indicator of age, then your correlation matrix would have 9 items that would represent 5 constructs.

Think about a hypothesis you have about how these constructs will relate to one another. For example, Intrinsic motivation will lead to greater (a) job satisfaction, (b) organizational commitment and (c) performance. Or Intrinsic motivation will lead to greater job satisfaction, which will in turn lead to greater organizational commitment.

11/2 Hierarchical Linear Modeling (Jennifer Mueller)

Readings

To prepare for this class you only need to read the following two articles posted in Web Café:

- a. Hofmann, D. A. (1997). An overview of the logic and rationale of hierarchical linear models. *Journal of Management. Special Issue: Focus on hierarchical linear modeling*, 23(6), 723-744.
- b. Singer, J. D. (1998). Using SAS PROC MIXED to fit multilevel models, hierarchical models, and individual growth models. *Journal of Educational and Behavioral Statistics*, 23(4), 323-355.

The other readings are NOT required but I'll use them to supplement our class discussion so I've made them available for you.

Assignment

The goal of this session is to introduce you to multi-level modeling (MLM) for purposes of publishing research in the social sciences. Because we will be covering a broader range of topics, we will not be able to delve too deeply into any one single topic. However, you should complete the assignment below so that you can spend more time focusing on the application(s) of MLM which you may find most valuable. Please note, I'll demonstrate MLM using SAS PROC Mixed for this course and not HLM (HLM is a statistical software that performs multi-level modeling) – so no need to buy HLM (although you can download a student version of HLM from the website for free). You

will not need to use or bring your laptops to class. If you would like to bring specific examples to class to build and test real time, please email me (jennm@wharton.upenn.edu) and I'll try to incorporate this into the class (assuming we are covering material relevant to your question).

Come to class prepared with your own data (or research idea) which you think might require MLM. Write out at least one hypothesis you wish to test. To test your hypothesis, identify which of the six MLM applications (from the list above) you would employ and identify why. If you are not sure which application would be best to use (or if your question requires yet another application of MLM not listed above), give your best guess about the application this question would require.

What is between-level variance? What is within-level variance? Which of the applications of MLM above requires that you first meet the criterion of showing sufficient between-level variance in your outcome? What statistic would you use to show that you have sufficient between-level variance in your outcome?

Class content:

1. Controlling for group level variance (or covariance) when analyzing level 1 data
2. Intercepts as outcomes
3. Slopes as outcomes
4. Multi-level mediation
5. Multi-level moderated mediation
6. Panel data – longitudinal data analysis

11/9 Networks (Lori Rosenkopf)

Readings

- 1) Bonacich, Phillip. 1987. "Power and Centrality: A Family of Measures." *The American Journal of Sociology* 92:1170-1182.
- 2) Krackhardt, David. 1992. "The Strength of Strong Ties: The Importance of Philos in Organizations." In N. Nohria & R. Eccles (eds.), *Networks and Organizations: Structure, Form, and Action*: 216-239. Boston, MA: Harvard Business School Press.
- 3) Podolny, Joel M., and James N. Baron. 1997. "Resources and Relationships: Social Networks and Mobility in the Workplace." *American Sociological Review* 62:673-693.

Assignment

This session will introduce you to the core ideas, constructs, and methods of network analysis. It will be split into two parts.

Part 1: In the first part, we will go through the readings and discuss the following questions:

1. Make a list of the core theoretical constructs and arguments introduced in the readings. Identify chronological and substantive links among them. Do you find the arguments credible?

What assumptions are they based on? Are these assumptions reasonable approximations of the reality that the arguments attempt to explain?

2. Assess the research designs in [2] and [3] in terms of their appropriateness for testing the theory presented. What are the strengths and weaknesses of the setting and data? Do the measures proposed adequately operationalize the theoretical constructs? Are the statistical methods applied correctly?

3. Are the conclusions of the studies [2] and [3] believable? Have major alternative interpretations of the findings been ruled out?

4. Could the measures from reading [1] inform studies [2] and [3]? If so, how exactly would you apply them?

Part 2: The second half of the class will offer you hands-on experience with the network data from study [2]. We will replicate the study's measures and assess their explanatory power with regard to the outcome of interest – a unionization drive at a small entrepreneurial Silicon Valley firm, here called Silicon Systems. The National Labor Relations Board informs the company that it is granting a petition by a national union to hold a certification election at Silicon Systems. Despite the support for the unionization drive, in the end, the union is defeated in the certification election by a vote of 12 to 3.

To understand how the firm's network structures led to the defeat of unionization drive, we will generate maps of the aggregate networks and attempt to answer the following questions:

1. What was the principal structural problem at Silicon Systems? In other words, why was the union drive popular initially?

2. What was the principal structural problem with the union drive? Why did the union drive ultimately fail?

3. Explain Chris's ambivalence. What may have driven him to resign his job before the union vote? How do you think this will affect his network position in the future?

Next, we will generate maps of Chris's cognitive picture of the friendship network (using file chrsfrnd.kp) to answer the following questions: Does this help us get a better sense of his ambivalence? Does it help us understand why the union drive failed?

Third, we will generate maps of Ev's cognitive picture of the friendship network (using file evfrnd.kp) to answer the following question: How good a read on the informal structure does Ev have? What kind of manager is he? Why does his management style get him into trouble?

Logistics

Please split into pairs and bring to class one laptop per pair. Those who will bring their laptops, please make sure before the class that you can access the server ucinet.wharton.upenn.edu.

Download into a separate folder on the U: drive all the data files that I posted in the eRoom for the course.

NOTE: Only the Management Department's PhD students have access to the server. Therefore, it is strongly preferable that each pair includes at least one student from the Management Department.

11/16 Simulations (Nicolaj Siggelkow)

Readings

Nicolaj Siggelkow and Jan W. Rivkin. 2005. "Speed and Search: Designing Organizations for Turbulence and Complexity." *Organization Science*, 16, pp. 101-122.

Nicolaj Siggelkow and Jan W. Rivkin. 2009. "Hiding the Evidence of Valid Theories: How Coupled Search Processes Obscure Performance Differences among Organizations." *Administrative Science Quarterly* 54, pp. 602-634.

Dirk Martignoni and Nicolaj Siggelkow. 2010. "When it Pays to be Neurotic or to Have Blind Spots: The Value of Understanding External and Internal Contingencies."

Corp-Dev-Spec : These are the specs that Vikas, Harbir and I sent to a programmer. The "Daedalus" program refers to the program that this programmer wrote for Jan and me.

(optional): If you are interested what became of the specs, here's the paper that resulted: Vikas Aggarwal, Nicolaj Siggelkow, and Harbir Singh. forthcoming. "Corporate Development Choices and Interdependence: Strategic Tradeoffs and Performance Implications." *Strategic Management Journal*.

Discussion questions

1. What roles can simulation models play? To which purposes are simulation models being used in the first three papers?
2. When are simulation models convincing, when are they not?
3. Dirk and I just received an R&R for our paper from SMJ. What do you think did the reviewers complain about? What would you have complained about?
4. Pick a question that you are interested in. Start sketching out a simulation model. Be as concrete as possible. Ideally, you could hand over your outline to a programmer. What tradeoffs are you facing? What aspect of this exercise did you find most difficult?

11/30 Content Coding (Sigal Barsade)

Readings

Content Coding

- Please read the **theory and methods sections only** :
 - Barsade, Sigal G. (2002). "The Ripple Effect: Emotional Contagion and its Influence on Group Behavior." Administrative Science Quarterly, 47, 644-675.
- Please read the **methods section only** :
 - Amabile, Teresa M., Barsade, Sigal G., Mueller, Jennifer S. & Staw, Barry M. (2005). "Affect and Creativity at Work." Administrative Science Quarterly, 50, 367- 403.

Inter-rater Agreement
